

Forward Deployment Engineer Test

Overview

This assessment tests your ability to independently integrate a live third-party API into a working application. You will integrate three of Pastel's Sigma AI product capabilities: Transaction Monitoring, PEP/Sanctions Screening, and Adverse Media Screening.

The goal is not just to make API calls. You are expected to build a clear, well-structured application that demonstrates your ability to read technical documentation, translate API capabilities into product value, and present data in a way a non-technical customer could understand. This mirrors the day-to-day work of a Forward Deployment Engineer at Pastel.

Sigma exposes three product areas relevant to this assessment:

- **Transaction Monitoring** — Analyses transactions in real time using AI to detect fraudulent patterns, flag suspicious activity, and return a risk level and recommended action.
- **PEP & Sanctions Screening** — Screens individuals or entities against global Politically Exposed Persons (PEP) lists and international sanctions databases (OFAC, UN, EU, etc.) to prevent regulated entities from transacting with prohibited parties.
- **Adverse Media Screening** — Searches news and media sources for negative coverage linked to an individual or entity, such as fraud allegations, criminal investigations, or financial misconduct.

What we are evaluating

API comprehension	Can you independently read documentation and correctly implement an unfamiliar API?
Data presentation	Do you present complex API responses in a way that is clean, structured, and accessible to a non-technical customer?
Attention to detail	Are all required fields present and correctly formatted? Are edge cases (missing fields, error responses) handled?
Product	Do you go beyond the bare minimum? Does your output help a

thinking	customer understand what the API is telling them and why it matters?
Communication	Is your README and submission clear? Could a Pastel customer success team member understand your demo?

Your Task

Build a mock application in any programming language or framework of your choice. The application must integrate Sigma's API and demonstrate all three capabilities described below. Your application should have a frontend interface to interact with.

The Sigma documentation is available at <https://sigma-docs.pastel.africa>.

You are to make use of the following API credentials:

API KEY	59d01b8c-7d29-4e25-8d93-c5c9f2bb0fdf
API SECRET	ad8a3c3f-1869-4947-94ad-bb216b792824

Task 1: Transaction Monitoring

Your application must:

1. Send a transaction to the Sigma Transaction Monitoring API using the instant endpoint
2. Include realistic, populated data in the
 - a. transactionData, device, and anonymizedUserData objects.
3. Display the following clearly in your application's output:
 - a. The transaction details you sent to Sigma (reference, amount, currency, sender, receiver, channel, type, date)
 - b. The full Sigma response, clearly formatted
 - c. The final action Sigma recommends (allow / flag / block) — prominently displayed
 - d. The risk level returned

Task 2: PEP & Sanctions Screening

Your application must:

1. Make a standalone API call to the Sigma PEP and Sanctions endpoint independently.
2. Pass the details of a information of individual as required by the documentation
3. Display the following clearly:
 - a. The information you sent to Sigma about the individual
 - b. The full Sigma response, clearly formatted with the match confidence

Task 3: Adverse Media Screening

Your application must:

1. Make a standalone API call to the Sigma Adverse Media endpoint.
2. Pass the details of a named individual (can be the same person as Task 2, or a different one).
3. Display the following clearly:
 - a. The information you sent to Sigma about the individual
 - b. The full Sigma response, clearly formatted
 - c. A clear summary: were any adverse media findings returned? What category of risk? What sources?

NOTE: You are not required to persist or save the data, you are only required to display the data for viewing purposes only.

Submission

Deploy your solution online and send in the frontend URL to access it to engineering@pastel.africa on or before Tuesday 24th March, 2026 9:00AM WAT
